

FOR IMMEDIATE RELEASE

Grass Valley, CA (January 27, 1997)

Super Edit Version 8.0, a new major software upgrade for Grass Valley Editing Systems is now available from Editware, Inc.

Designed specifically for users of all VPE editors and IPS Integrated Production Systems, this software package provides major enhancements to the online editing process. Version 8.0 includes new modes of video previewing, such as aux bus previewing on the Grass Valley Model 200 and other switcher models. The software also includes support for high density (1.44MB) floppy disks and for higher capacity (PCMCIA) hard disk drives, larger EDLs and easier interchange of EDLs with other computers.

Super Edit Version 8.0 also features major improvements in controlling digital video switchers, including timeline control and storage and recall of individual E-MEM effects levels. The software also includes enhanced pre-read editing, and it has a powerful control mode for all switchers, allowing the operator to treat an entire switcher setup like a source machine.

Editware was established in Grass Valley, CA in early 1996 with the support of Tektronix - Grass Valley Products. In addition to augmenting the ongoing engineering and customer support of Super Edit software and VPE editors for Tektronix, Editware provides after-market options, new software releases, VPE editing system upgrades and reconditioned editing systems.
